Notes:

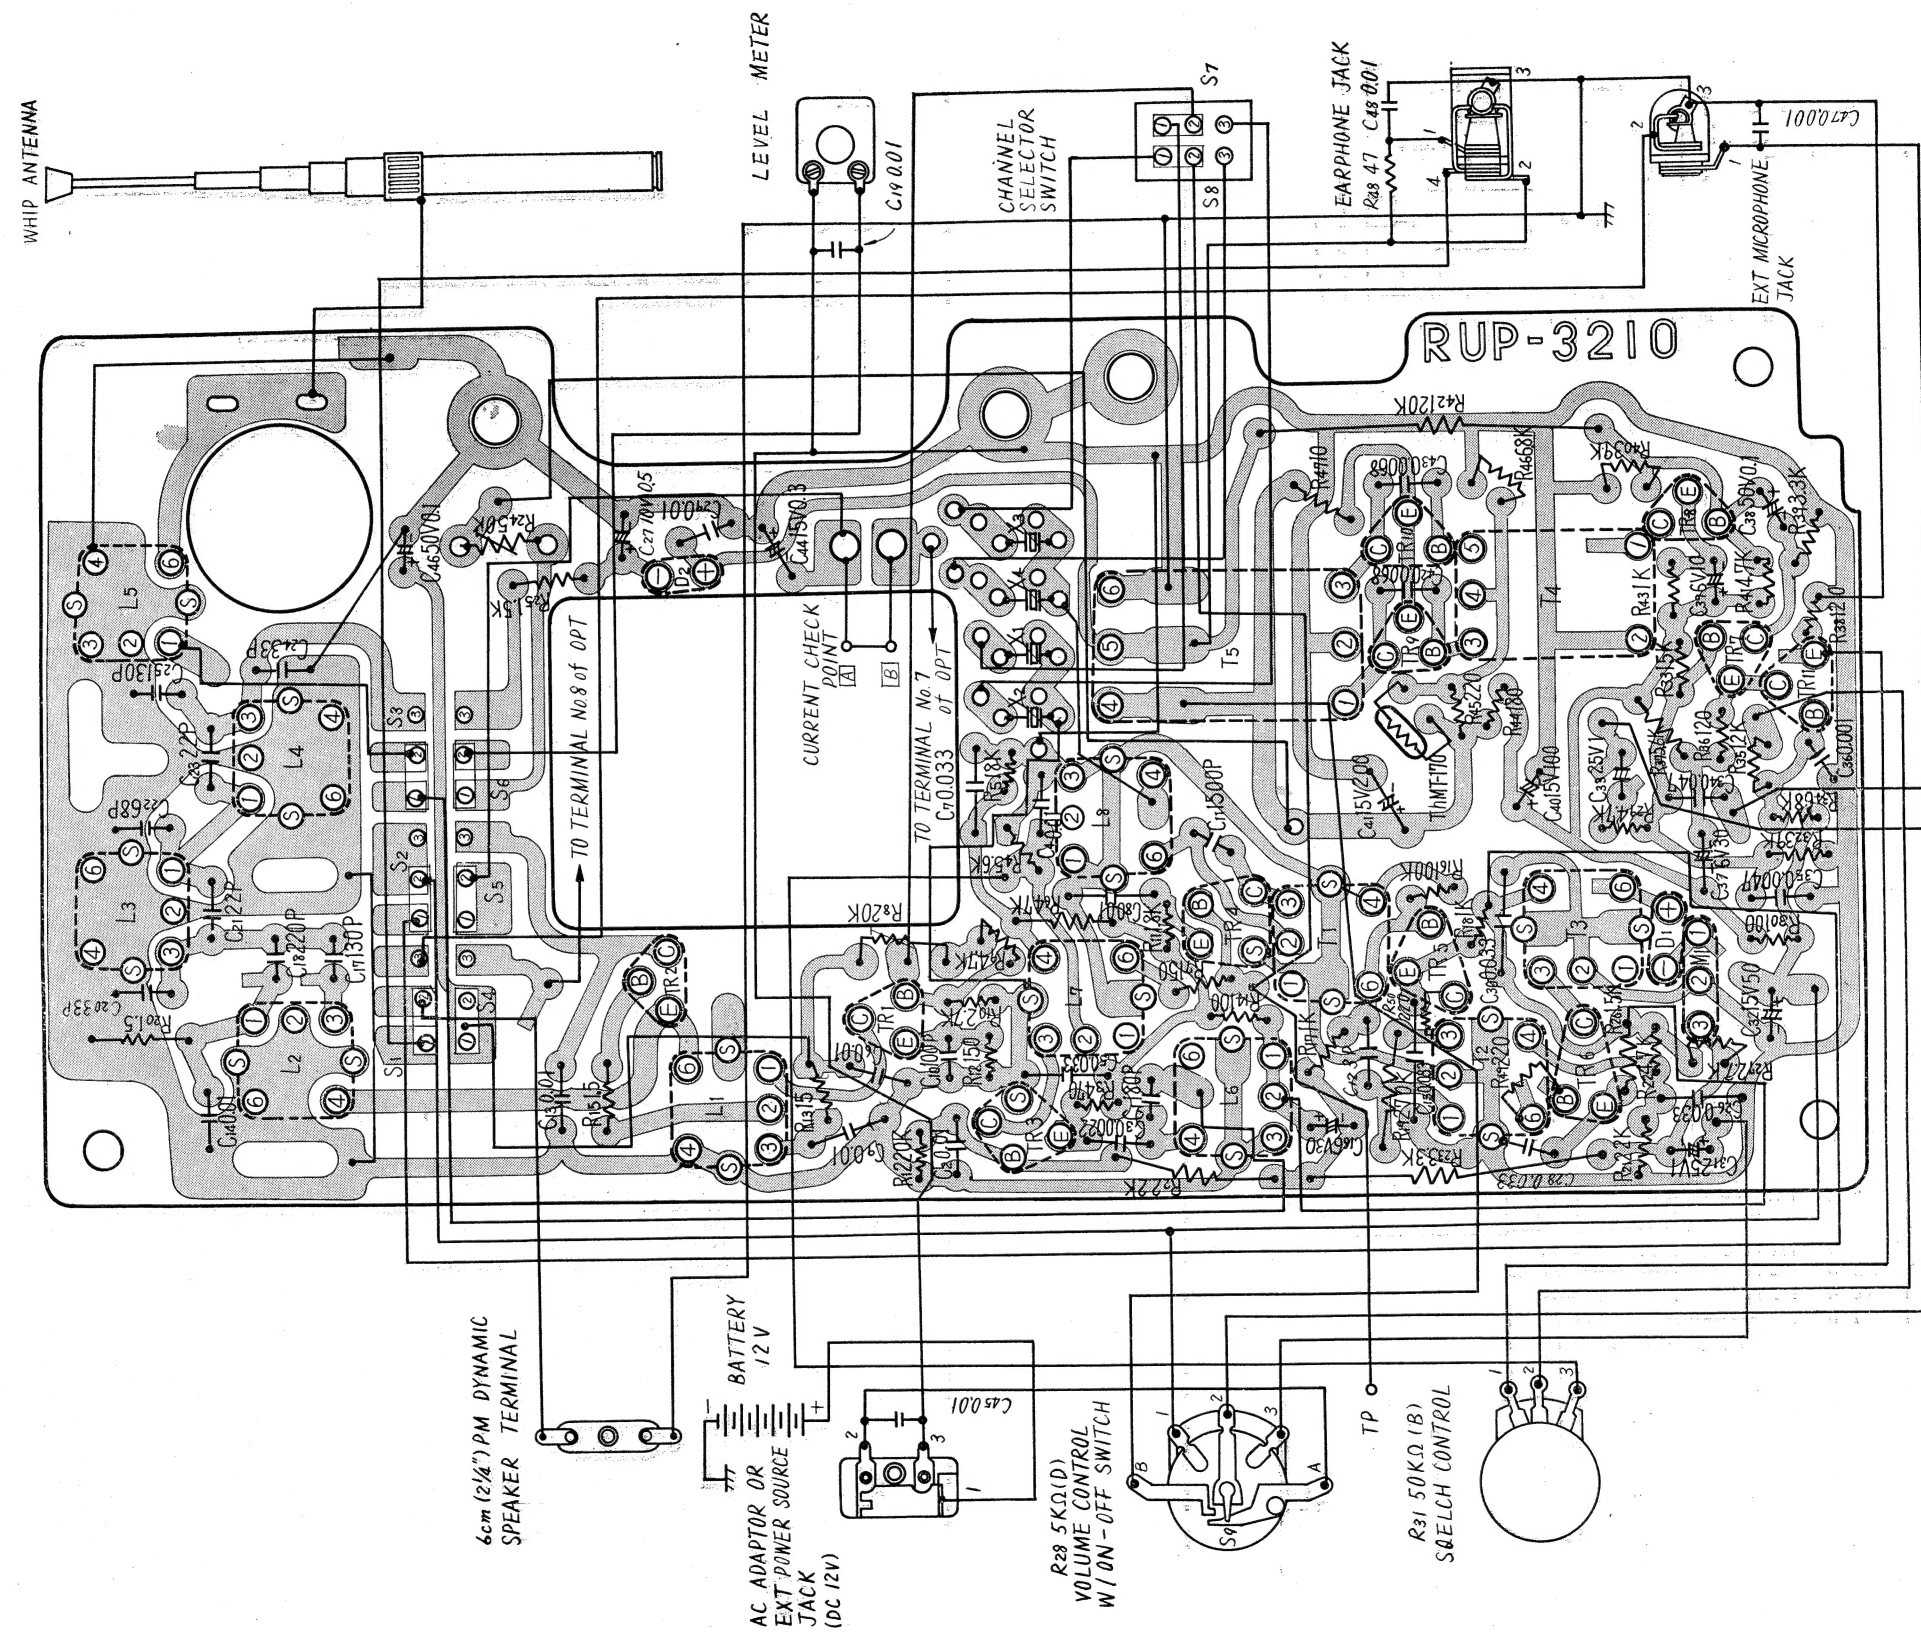

1. In all the above alignments, keep signal generator output low enough to maintain reading of 0.5 volts or less on VTVM to avoid AGC action.
2. Use only non-metallic alignment tools to insure proper alignment.
3. After alignment has been completed, all coil slugs that have been moved during alignment should be rewaxed to insure stability of operation with same type wax originally used.

1. S1~S6: Push to talk switch in "RECEIVE" position.
2. S7, S8: Channel selector switch in "A" position.
3. S9: Power source switch in "OFF" position.
4. DC Voltage measurements are taken with circuit tester (10K Ω /Volt) from negative terminal of battery.
5. Capital letters (M, K, J, P, C, D) in the circuit diagram show allowable tolerances of resistors and capacitors as follows:
M=±20% K=±10% J=±5% P=+100%
C=±0.25PF D=±0.5PF
6. Battery Current:
Receiver.....13mA (at no input signal)
.....67mA (at maximum output)
